

Have you ever had your windshield wipers replaced and you still were not satisfied with the way they cleared the windshield on your car? Next time you have your wipers replaced try this. Use some very fine steel wool with glass cleaner and make several uniform passes over the windshield and rinse or wipe the remaining residue off the windshield.

What this does is removes any road film that is on your windshield and allows your wipers to perform at their best, and it will not scratch your windows. You can also do this every once and a while to keep your wipers performing well. Also it does help to take a towel with glass cleaner and wipe the road film off the rubber portion off the wiper as well.
